<https://www.pengutronix.de>

What's this about

- Pengutronix integrates OP-TEE for many customers across different SoCs
- We are codifying best practices and looking how this can best fit with upstream

What's this about

- Pengutronix integrates OP-TEE for many customers across different SoCs
- We are codifying best practices and looking how this can best fit with upstream
- I am interested in wider input

1) Traceability

- Why did an integrator configure OP-TEE in a specific way?

1) Traceability

- Why did an integrator configure OP-TEE in a specific way?
- Idea: Keep two configs in the (e.g. Yocto) BSP:
- manually maintained config for CFG_OPTEE_CONFIG:
only our own overrides and with explanatory comments
 - Full config (à la olddefconfig) to see defaults changing over updates

2) Documentation

- While Kconfig would be direly needed, can we have an intermediate step to start documenting CFG_ options?

2) Documentation

- While Kconfig would be direly needed, can we have an intermediate step to start documenting CFG_ options?
- Idea: Start keeping machine readable files with CFG_ documentation
- Grandfather all options in at once with an empty help text
 - Build target generates ReST CFG_ documentation from optee_os
 - All CFG_ options referenced in the Makefiles must be reflected in the help files and enforced by pull request check

2) Documentation

- While Kconfig would be direly needed, can we have an intermediate step to start documenting CFG_ options?
- Idea: Start keeping machine readable files with CFG_ documentation
- Grandfather all options in at once with an empty help text
 - Build target generates ReST CFG_ documentation from optee_os
 - All CFG_ options referenced in the Makefiles must be reflected in the help files and enforced by pull request check
-
- Idea #2: This format could even be Kconfig parsed via kconfiglib

3) Migration Notes

- Migration notes make integrator life much easier. Examples:
 - <https://docs.yoctoproject.org/dev/migration-guides/migration-5.2.html>
 - <https://www.barebox.org/doc/latest/migration-guides/migration-2025.05.0.html>

3) Migration Notes

- Migration notes make integrator life much easier. Examples:
 - <https://docs.yoctoproject.org/dev/migration-guides/migration-5.2.html>
 - <https://www.barebox.org/doc/latest/migration-guides/migration-2025.05.0.html>

→ Upsides for OP-TEE: Have a way to inform user of deprecation and removal or change of defaults, e.g. switching CFG_CORE_HUK_SUBKEY_COMPAT to disabled
